Prerequisite:	Students are expected to have a thorough knowledge of all material covered in an introductory finance course.
----------------------	---

Course Overview

In the last three decades, there have been some remarkable losses seen in the financial markets; for example, the October 1987 market crash, 1998 LTCM crisis and the 2007-2008 subprime mortgage crisis, to name but a few. Accordingly, organizations have embraced sound risk management practices to avoid exposing themselves to unnecessary financial risks on the one hand, and taking calculated risks on the other. In particular, organizations have embraced derivatives as a risk management and hedging vehicle to the extent that many corporations now feature risk management divisions. It is likely that risk management issues will continue to arise in the majority of business scenarios. With these in mind, this course is designed to equip students with the essential frameworks and tools needed to understand and effectively manage financial risks. The primary focus will be on pricing derivatives, particularly forward, futures, options and swaps, using various state-of-the-art techniques.

Course Goals

After successfully completing this course you should be able to:

- 1 Understand the operation of derivatives markets (options, futures, forwards and swaps)
- 2 Identify different derivative products that are available in the financial market
- 3 Master the fundamental concepts in pricing derivative instruments using various state-of-the-art techniques
- 4 Demonstrate how a range of derivative products can be used to hedge and speculate market risk

Grading Policy

Mid-semester Exam	30%
Report (Individual Assignment)	20%
Final Exam	50%

Grading Scale is as follows:

Number grade	Letter grade	GPA
90-100	A	4
85-89	A-	3.7
80-84	B+	3.3
75-79	B	3
70-74	B-	2.7
67-69	C+	2.3
